### What Are Prime Numbers?

#### Definition

A prime number is a number that has exactly two divisors.

▶ 2 is prime (two divisors: 1 and 2).

### What Are Prime Numbers?

#### Definition

A prime number is a number that has exactly two divisors.

- ▶ 2 is prime (two divisors: 1 and 2).
- ▶ 3 is prime (two divisors: 1 and 3).

### What Are Prime Numbers?

#### Definition

A prime number is a number that has exactly two divisors.

- ▶ 2 is prime (two divisors: 1 and 2).
- ▶ 3 is prime (two divisors: 1 and 3).
- ▶ 4 is not prime (three divisors: 1, 2 and 4)

The proof uses reductio ad absurdum.

### **Theorem**

There is no largest prime number.

### Proof.

1. Suppose *p* were the largest prime number.

The proof uses reductio ad absurdum.

#### Theorem

There is no largest prime number.

- 1. Suppose *p* were the largest prime number.
- 2. Let *q* be the product of the first *p* numbers.
- 4. But q + 1 is greater than 1, thus divisible by some prime number not in the first p numbers.

The proof uses reductio ad absurdum.

#### Theorem

There is no largest prime number.

- 1. Suppose *p* were the largest prime number.
- 2. Let q be the product of the first p numbers.
- 3. Then q + 1 is not divisible by any of them.
- 4. But q + 1 is greater than 1, thus divisible by some prime number not in the first p numbers.

The proof uses reductio ad absurdum.

#### Theorem

There is no largest prime number.

### Proof.

- 1. Suppose *p* were the largest prime number.
- 2. Let *q* be the product of the first *p* numbers.
- 3. Then q+1 is not divisible by any of them.
- 4. But q + 1 is greater than 1, thus divisible by some prime number not in the first p numbers.

The proof used reductio ad absurdum.

### What's Still To Do?

How many primes are there?

### Open Questions

Is every even number the sum of two primes?

### What's Still To Do?

Answered Questions How many primes are there?

### Open Questions

Is every even number the sum of two primes? [1]

```
int main (void)
std::vector<bool> is_prime (100, true);
for (int i = 2; i < 100; i++)
return 0;
```

```
int main (void)
std::vector<bool> is_prime (100, true);
for (int i = 2; i < 100; i++)
if (is_prime[i])
return 0;
```

```
int main (void)
std::vector<bool> is prime (100, true);
for (int i = 2; i < 100; i++)
if (is prime[i])
std::cout << i << " ";
for (int j = i; j < 100;
is prime [j] = false, j+=i);
return 0;
```

```
int main (void)
std::vector<bool> is prime (100, true);
for (int i = 2; i < 100; i++)
if (is prime[i])
std::cout << i << " ";
for (int j = i; j < 100;
is prime [j] = false, j+=i);
}
return 0;
```

Note the use of std::.

### <+-> on a frame

### Theorem

A = B.

- ightharpoonup Clearly, A = C.
- ▶ Thus A = B.

### Theorem

A = B.

- ightharpoonup Clearly, A = C.
- ▶ As shown earlier, C = B.
- ▶ Thus A = B.
